Often filled with jargon, acronyms and directions that require Ph.D to understand, software user manuals are sometimes written from a developer's point of view rather than from a user's point of view. As a result, the guide can make assumptions about the reader's skill level, which is often wrong. The first step in writing a good user guide is to get the actual writing process as far from engineers as possible. The software developer knows more than anyone else that makes the software work, but that doesn't mean that the developer should write a guide. On the contrary, it has a different disadvantage. More important than a deep understanding of the internal functioning of the software is the understanding of who the end user will be, what his level of education will be and how that end-user will use the software. In most cases, end users don't need to know the finer points of programming and back-end operation of the software – they just need to know how to use it to make their job easier. The user manual should be task-oriented to a large extent, not very descriptive. Since the guide is written to help users understand how to perform specific tasks, the writer must have an understanding of tasks as well as, as a result, go go each individual step is absolutely essential for each function. It is not necessary for the writer to always know how the program was created from a design or development point of view, but it is important to have a strong working knowledge of all its functions. Take time to take time to record each activity, including clicks, drop-down menus, and more. Although the developer may not be the one to write the manual, she will still be a valuable resource for the writer, and before writing begins, plan a kickoff meeting between the writer, developer and engineer, and potential end users to help inform the writer's work from the beginning. Interviews with topic experts and engineers should be recorded, indicating transcripts for a later reference. The user guide must not be too large for text. Rather, include liberal use of graphics and screen clips. The description of the action is much clearer in the directions of the text, along with a screen clip that clearly shows that direction. Include both before and after views to show how the screen looks before each action and what happens after the action. A simple screen capture utility, such as the Snipping Tool included with Microsoft Windows, works well for capturing these images. Be sure to number each picture and include a caption that briefly describes it. Center it just below the paragraph that first introduces the concept in the picture. In order to be clearly announced in a technical document, standards must be planned and carefully followed throughout the roadmap. Standards in design, language and nomenclature help to avoid misunderstandings. Templates are available and can be a good starting point for uniformity, although they can certainly be customized to suit each situation. Using a single-inch margin with a single column best suits the need to add a graphic; the two-column setting may appear too crowded and may make the image placement confusing. More than any other type of document, the software user guide could go through several iterations before it is completed, and it could go through a review process by several stakeholders. Using track changes in Microsoft Word is an easy way to track comments and changes for each individual. Creating multiple versions after each review cycle, each with a different file name, also helps the process together and ensures that all stakeholders are satisfied with the final result. Unless you can imagine a clever way to store them, user guides are some kind of hassle to keep around. If you find yourself in need of one, however, the Central Guide allows you to find and download them for free in PDF format. The general buzz (as far as I can remember) is focused on the end of the year or perhaps the next site. Either way, I just hope they'll release the new iPad Pro already cuz I'm looking forward to buying one job, but it just doesn't make sense to buy an existing iPad Pro right now..... lol think a lot of people (here) are probably in the same situation. The current iPad Pros are much stronger than most people ever need, but as we know there's a refresh coming, we're holding off. For me, native mouse support with a kind of Apple keyboard (with trackpad) is a game changer for me – I could finally watch to replace my laptop with iPad.Score: 7 Voices (Like | Disagree)
